

HOTEL MANAGEMENT SYSTEM

ReactJS Based Web Application

Presented By:

Introduction

The **Hotel Management System** is a modern web-based application designed to streamline hotel operations and enhance the guest experience.

Built using **ReactJS**, it addresses the growing need for digital transformation in the hospitality industry by replacing manual processes with efficient, automated solutions.

The system bridges the gap between traditional hotel management and modern technology, providing a seamless experience for both guests and staff.

It demonstrates practical implementation of modern frontend development concepts including components, state management, and client-side routing.

Project Highlights

-  **ReactJS Frontend**
Modern component-based UI development
-  **User-Friendly Interface**
Intuitive design for guests and staff
-  **Local Storage**
Client-side data persistence
-  **Responsive Design**
Works across all device sizes

Abstract

The **Hotel Management System** is a web-based application developed using **ReactJS** to simplify hotel operations such as room booking, room service management, food ordering, and customer support.

The system provides a **user-friendly interface** that improves customer experience and hotel efficiency. Key capabilities include budget-based room booking, real-time availability checking, digital receipt generation, and centralized service request management.

Built with modular React components using **hooks, Context API, and React Router** for state management and navigation. All data is persisted using browser **Local Storage**, ensuring seamless user experience without backend dependencies.

Key Capabilities

Room Booking

Budget-based search

Service Management

Centralized requests

Digital Receipts

Auto-generated records

Local Storage

No backend needed

Problem Statement

Time-Consuming Manual Booking

Manual booking process is time-consuming and prone to scheduling conflicts and double bookings.

Customer Record Management

Difficult to manage customer records and maintain accurate historical data over time.

Decentralized Service Requests

Service requests are not centralized, leading to delayed responses and missed requests.

Human Errors

Increased chances of human errors in billing, room allocation, and record keeping.

No Real-Time Availability

Lack of real-time room availability information causes frustration for potential customers.

No Digital Accountability

No digital trail for accountability, making performance tracking and audits impossible.

| Objectives

01

Automate Room Booking

Real-time availability with instant confirmation

02

Digital Service Management

Centralized dashboard for all hotel services

03

Improve Customer Satisfaction

Seamless self-service options for guests

04

Reduce Paperwork

Digitize all hotel operations and records

05

Easy Access to Facilities

Food, cleaning, and emergency services

06

Digital Receipts

Transparent booking records and receipts

Project Goal

To build a comprehensive, user-friendly hotel management platform that eliminates manual processes, reduces errors, and provides guests with a seamless digital experience for all hotel services.

| Technologies Used

ReactJS

Core frontend library for building component-based user interfaces

React Router

Client-side routing for seamless page navigation

Context API

Global state management across all components

JavaScript (ES6+)

Modern JS features and syntax for application logic

HTML5 & CSS3

Semantic markup, styling, and responsive design

Local Storage

Client-side data persistence without backend

System Architecture

Presentation Layer

React Components, Pages, and UI Elements that users interact with

State Management Layer

Context API for global state, useState / useReducer for local component state

Routing Layer

React Router for navigation between modules and pages

Data Layer

Local Storage for persistent data, in-memory state for session management

Component Hierarchy: App → Router → Layout → Pages → Components | Unidirectional Data Flow

Modules

Login & Signup

User authentication and account creation system

Dashboard

Centralized overview of all hotel services

Book Room

Budget-based search and room booking

My Bookings

Booking history with receipts and cancellation

Room Service

Request amenities and hotel services

Room Cleaning

Schedule cleaning and maintenance

Food Ordering

Browse menu and order food to room

Emergency Help

Quick access to emergency contacts

Admin Panel

Manage rooms, bookings, and service requests

React Concepts Used

Functional Components

Reusable UI components with clean, declarative syntax

React Hooks

useState, useEffect, and useContext for state and effects

React Router

useNavigate, useParams, useLocation for dynamic routing

Context API

createContext and Provider for global state management

Component Lifecycle

useEffect for data fetching, subscriptions, and cleanup

Conditional & List Rendering

Dynamic UI based on state, roles, and data availability

These React concepts work together to create a **modular, maintainable, and scalable** application architecture with clean separation of concerns and reusable code.

| Key Features

Budget-Based Room Booking

Filter and book rooms within preferred price range

Room Availability Check

Real-time status of room occupancy and availability

Booking Receipt

Auto-generated digital receipt with booking details

Booking Cancellation

Easy cancellation with confirmation and refund tracking

Food Ordering

Complete menu browsing and room service food ordering

Room Cleaning Requests

Schedule one-time or recurring cleaning services

Room Service Requests

Request amenities, maintenance, and additional items

User-Specific Bookings

Personalized dashboard with complete booking history

Future Scope

Online Payment Integration

Secure payment gateways for online transactions

Mobile Application

React Native app for cross-platform access

AI-Powered Chatbot

24/7 customer support and query resolution

Real-Time Notifications

SMS and email alerts for booking updates

Advanced Analytics

Revenue insights and performance dashboard

Multi-Language Support

Support for international guests worldwide

Review Platform Integration

Third-party reviews and rating systems

Cloud-Based Backend

Database for multi-hotel chain management

CONCLUSION

The **Hotel Management System** provides an efficient and user-friendly solution for managing hotel operations.

It demonstrates the practical implementation of **ReactJS concepts** such as components, hooks, routing, and state management while improving customer convenience and hotel efficiency.

The system successfully bridges the gap between traditional hotel management and modern technology solutions.
